Results at a glance

**Household questionnaire** (aged 15 or above)
- Number of domestic households: 7,448
- Number of respondents: 16,655
- Household response rate: 73.3%

**Health examination** (aged 15 to 84)
- Number of participants: 2,072
- Participation rate: 55.2%

**Self-reported viral hepatitis status** (aged 15 or above)
- 2.4% diagnosed with viral hepatitis
- 2.1% diagnosed with hepatitis B
- 3,400 persons with hepatitis B diagnosed in the 12 months preceding the survey

**Prevalence of viral hepatitis** (aged 15 to 84)

**Hepatitis A**
- Proportion having received hepatitis A vaccination: 5.7%
- Prevalence of anti-HAV: 58.7%
- Prevalence of anti-HEV positive or borderline positive: 10.0%

**Hepatitis E**
- Borderline positive: 4.8%
- Positive: 5.9%
- Borderline positive: 4.2%

Prevalence of anti-HAV and anti-HEV increases with increasing age.
Prevalence of viral hepatitis (aged 15 to 84)

Hepatitis B

HBsAg prevalence was low in young adults, as compared with those aged 35 or above

Prevalence of HBsAg: 6.2%

HBsAg positive:
- <2% (Aged 15 - 34)
- ~8% (Aged 35 - 64)
- ~7% (Aged 65 or above)

Among HBsAg+ participants

Markers of HBV replication

- Proportion tested positive for HBeAg: 4.5%
- Proportion having HBV DNA ≥ 2000 IU/mL: 31.8%

Care continuum

- Proportion self-reported as current hepatitis B carrier: 61.6%
- Proportion having follow-up medical care: 29.9%
- Proportion ever having antiviral therapy: 13.5%

Hepatitis C

- Prevalence of anti-HCV: 0.32%
- Prevalence of viremic HCV infection: 0.26%
- HCV genotype distribution: 1b

Proportion self-reported as current hepatitis B carrier: 61.6%
